A Towed Air Start Unit (TASU) is a mobile ground support equipment used in aviation to provide compressed air for starting aircraft engines. It is typically towed by a vehicle and consists of a compressor, air storage tanks, and necessary controls and connections to deliver the compressed air to the aircraft.

TASUs are commonly used in situations where there is no available ground power source or when the aircraft's own power unit is not functioning. They are designed to provide the necessary air pressure and flow rate required to start aircraft engines, which can vary depending on the size and type of the aircraft.

TASUs are equipped with hoses and connectors that can be attached to the aircraft's air start inlet, allowing the compressed air to flow into the engine and initiate the starting sequence. Once the engine is started, the TASU can be disconnected and moved away from the aircraft.
