A tower top preamplifier is an electronic low-noise amplifier placed on a telecommunications tower (also known as a base transceiver station) close to the antenna. The main function of the amplifier is to reduce the noise figure, thereby increasing the overall sensitivity of the base transceiver station. Before the received signal enters the feeder, the received signal can be amplified by nearly 12dB, which improves the uplink signal quality, improves call reliability and voice quality, and at the same time expands the cell coverage area.

Internet of Things (IoT) technology has gained significant traction over the past few years due to the increase in the number of connected devices. Various telecom providers are offering IoT-based services to small and large businesses. Internet of

Things (IoT) technology is cost-effective and offers various benefits to consumers, such as M2M (machine-to-machine) communications and wireless transactions. The growth of tower amplifiers has been fueled by the evolving network infrastructure and the rising number of smartphone users has led to an increased need for new network infrastructure to balance the increasing network traffic and enhance communications. Continuous improvements and innovations in the telecom industry, increasing government investments in developing the telecom industry, and increasing use of mobile phones for internet access are driving market expansion.
