Toy voice chips are a type of special integrated circuit that integrates voice storage, playback, sound effect control and interface driver. They are mainly used to realize voice prompts, onomatopoeia simulation, interactive sound effects and other functions in electronic toys. The chip is integrated with voice Flash or OTP memory, which can support voice content from seconds to minutes according to capacity requirements, and can be triggered by buttons, sensors, Bluetooth or serial ports. High-end products support compression formats such as MP3 and ADPCM. Some chips also integrate audio decoders, speaker drivers, PWM outputs, recording functions or voice recognition functions, which are suitable for smart toys with interactive and educational functions. The chip has the characteristics of low power consumption, small size, low cost, flexible function customization, etc., and is one of the key components for the electronic and intelligentization of toys.
