## Abstracts

The global TPU Anti-yellowing Agent market size is predicted to grow from US\$ 2249 million in 2025 to US\$ 3051 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

TPU anti-yellowing agents are additives used in polyurethane elastomer (TPU) materials to prevent yellowing, cracking, and aging caused by light, oxidation, and high temperatures. These additives improve TPU's weather resistance and extend its service life. They generally exhibit good compatibility, low volatility, and excellent solubility, making them suitable for a variety of polyurethane elastomer products.

The upstream sector primarily involves the synthesis of basic chemicals and fine chemicals. Core raw materials include benzotriazoles, hindered amines (HALS), phosphites, and antioxidant intermediates. The purity of these raw materials and the synthesis process directly determine the efficacy of the anti-yellowing agent.

Global sales in 2025 were approximately 263,000 tons, with an average selling price of US\$8,742 per ton. The industry's gross profit margin was around 25%.

In the field of high-performance elastomer additives, TPU anti-yellowing agents are evolving from simple 'appearance modifiers' to 'lifespan extenders' that improve the overall weather resistance of materials. As the application of thermoplastic polyurethane in high-end consumer electronics and automotive exterior parts continues to increase, end-users' demand for 'transparency' is gradually rising. Anti-yellowing agents are rapidly iterating towards higher heat resistance, lower migration, and deep compatibility with aliphatic TPU systems. The core of future competition will no longer be single-component additives, but rather molecular-level hybrid compounding technology. As

polyurethane materials develop towards high-end and long-life applications, high-performance anti-yellowing additives that improve light stability and weather resistance will maintain rapid growth.
