The global Trabecular Ablation market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Trabecular ablation (Trabectome) is a minimally invasive trans-intraoperative trabeculectomy, mainly used to treat open-angle glaucoma. Trabecular ablation uses a high-frequency electrocoagulation head to remove part of the trabecular meshwork and the inner wall of the Schlemm's canal to enhance the drainage pathway of the aqueous humor trabecular meshwork and achieve the purpose of lowering intraocular pressure. During the operation, the high-frequency electrocoagulation head uses its tip to pass through the trabecular meshwork to reach the Schlemm's canal. At the same time, the irrigation head at the top maintains the anterior chamber morphology and heat dissipation during the operation, and uses the suction head to suck out the stripped angle tissue.

Trabecular ablation is mainly suitable for early and mid-stage open-angle glaucoma, including primary open-angle glaucoma, pigmentary glaucoma and other glaucoma with open angles. The operation is safe and effective, with few complications, avoiding the risks and related complications associated with filtration blebs.
