A Tracheostomy Speaking Valve is a medical device used by patients with a tracheostomy—an opening created in the windpipe (trachea) to assist breathing. The valve is attached to the tracheostomy tube and allows air to flow into the lungs during inhalation but closes during exhalation, directing air through the vocal cords, enabling speech. It helps patients regain their ability to speak while still using the tracheostomy for breathing. These valves are particularly beneficial for improving communication, quality of life, and respiratory function. They are commonly used in hospitals, long-term care facilities, or at home by individuals who require ongoing ventilatory support but wish to speak.
