Track Digital Axle Counting System is a device on a railway that detects the passing of a train in lieu of the more common track circuit. A counting head (or 'detection point') is installed at each end of the section, and as each axle passes ahead at the start of the section, counter increments. As the train passes a similar counting head at the end of the section, that counter decrements. If the net count is evaluated as zero, the section is

presumed to be clear for a second train.
