The Track-mounted Screening Plant is a screening device with self-propelled mobility. It uses a crawler undercarriage as the walking mechanism, enabling flexible movement between different work sites. Driven by mechanisms such as vibrating motors, it generates vibrations to make the material in the screen box perform a throwing motion on the screen surface. Materials of different particle sizes are separated by grade according to the screen mesh size during the motion, with fine particles passing through the mesh and large particles being retained, thus completing the screening operation.
