The global Track Occupancy Detection System market size is predicted to grow from US\$ 1840 million in 2025 to US\$ 3025 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

Track Occupancy Detection System is a safety critical railway signaling function that determines whether a defined section of track is occupied by a train or clear, and then provides that status to systems such as interlockings and traffic control so routes can be set, signals can be cleared, and train separation can be maintained safely. It is commonly implemented using fail safe technologies such as track circuits that detect a train through the electrical behavior of the rails or axle counters that detect wheel passages at section boundaries, and it is used across mainline rail, metro, and yard environments to prevent conflicting movements and support efficient operations.
