Photolithography is a well understood process that has been used since the industry was established. The process is similar to that used in photography - hence the name. The process is a method of patterning silicon wafers to allow selective removal or addition of material to specific areas on the wafers determined by their design.

A 'track' sequentially processes semiconductor wafers for coating or developing of the photo sensitive layer either before or after exposure . The 'track' system is series of process modules to allow sequential processes to be carried out automatically on the wafer. These processes normally focus on the coating of the wafers with the photosensitive materials or removal of the desired area in the development stage. Tracks can be configured for coating and developing, or just one of the processes depending on the customer need, throughput requirements and factory layout.
