A Tracking-type Optical Pen Measurement System is a portable industrial metrology system designed for shop-floor and in-situ dimensional inspection. It typically integrates an optical tracker or camera-based tracking unit, a handheld light pen or wireless tactile probe, ruby-ball styli, reference targets, computing hardware and metrology software. By using optical tracking, photogrammetry, infrared target recognition or six-degree-of-freedom pose calculation, the system determines the spatial position and orientation of the handheld probe and converts each probe contact into accurate 3D coordinate data. The system is primarily used for dimensional inspection, GD&T verification, fixture adjustment, benchmark marking, large-part assembly, reverse engineering and production-site quality control. This study focuses on portable optical CMMs, optical tracking probe systems, light-pen-type coordinate measuring systems and reverse-positioning CMMs used in industrial measurement environments.
