Traditional Liquid Alkaline Electrolyser consists of an electrolyzer, an anode, a cathode and a power supply. In an electrolyzer, the anode and cathode are connected to the positive and negative terminals of the power source, respectively, while the electrolyte is placed in the electrolyzer. When an electric current is passed through the electrolyzer, the water molecules in the aqueous solution are broken down, producing hydrogen gas to be released at the cathode and oxygen gas to be released at the anode.

The global Traditional Liquid Alkaline Electrolyser market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
