## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Trans-azobenzene is an aromatic compound formed by two benzene rings connected by a nitrogen-nitrogen double bond (-N=N-), and in this configuration, the azo groups on the two benzene rings are on opposite sides, forming a relatively stable structure. The general formula of the azobenzene group is Ar-N=N-Ar', where Ar and Ar' represent benzene rings or their derivatives. In the molecular structure of trans-azobenzene, the nitrogen-nitrogen double bond connects the two benzene rings, making the entire molecule present a certain planarity and symmetry. In the trans configuration, this planarity and symmetry are further strengthened. Due to its stable structure and specific molecular configuration, trans-azobenzene exhibits a series of unique physical and chemical properties. For example, trans-azobenzene exhibits high transparency and low absorption coefficient in optical properties, which makes it have potential application value in the field of optical materials.

The global Trans-azobenzene market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
