Transformer breathing is a process where the increased load on the transformer results in the heating up of the insulating oil, which in turn, expands and is expelled out into the conservator tank fitted on the top of the power transformer. A transformer breather is a type of equipment that is connected to the conservator of an oil-immersed transformer. It consists of silica gel breathers, which are capable of absorbing the moisture from the air that passes through the breather. It enables the dry air to pass through and thus, enhances the life of the transformer oil and in turn, the transformer.
