The global Transformer Coolers market size is predicted to grow from US\$ 4896 million in 2025 to US\$ 7979 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

When there is a temperature difference in the upper oil temperature of the transformer, the oil circulation is formed through the radiator, so that the oil flows back to the oil tank after being cooled by the radiator, which has the effect of reducing the oil temperature of the transformer.

A transformer cooler is a cooling system for power transformers that maintains the temperature of the transformer and prevents it from overheating. The size of this market is dependent on the growth of the power sector, expansion of electricity transmission and distribution infrastructure, and replacement needs of aging transformers in advanced economies. The main types of coolers in the market include air-cooled, oil-cooled and water-cooled coolers, which can be used alone or in combination to increase cooling efficiency. With the modernization of the power industry and the increasing adoption of renewable energy sources, the transformer cooler market is also evolving.
