Abstracts

The global Transformer Neural Networks market size is predicted to grow from US\$ 32038 million in 2025 to US\$ 138992 million in 2032; it is expected to grow at a CAGR of 23.4% from 2026 to 2032.

Transformer Neural Networks are a class of deep learning architectures designed to model sequential and structured data using a self-attention mechanism rather than recurrence or convolution. Transformers compute relationships between all elements in an input sequence simultaneously, allowing the model to capture long-range dependencies efficiently and in parallel. The core components include multi-head self-attention, which learns different relational patterns across positions, and position-wise feed-forward networks, with positional encodings added to preserve order information. This architecture enables superior scalability and performance on large datasets and has become the foundation of modern natural-language processing, computer vision, speech, and multimodal systems.
