the hydroelectric power plant generates the energy, but the electricity that is generated isn't the correct voltage to power people's homes. This is where electrical transformers come in. The electrical transformer converts the alternating current that the hydroelectric power is generating into a high voltage current.

This converted power supply that is coming from the transformer is connected to the national grid, where it is then distributed for domestic and industrial use. This high voltage current is still a bit too strong for most applications, and so a series of transformers are installed at various locations that reduce the voltage to a voltage required for domestic and industrial applications (110V or 230V).
