A circuit with an inductive or capacitive energy storage element will have different parameters when the energy storage element is turned on and off instantaneously than when the circuit is in a steady state. The process of analyzing the voltage and current parameters of these components when the switch is closed and opened is called transient analysis. Transient response refers to the change process of the system output from the initial state to the stable state under the action of a typical signal input. Transient response is also called dynamic response or transient process or transient response. The equipment with good transient response should respond immediately as soon as the signal comes, and stop as soon as the signal stops.
