Transient elastography equipment is a medical equipment used in transient elastography technology, which can be divided into independent equipment and mobile equipment. It consists of three key parts: a transducer that generates ultrasonic waves and ACTS as an ultrasonic receiver; a probe that emits low-frequency vibration waves on the transducer; a software program that can record and analyze data; and it is widely used in the detection of liver disease patients and internal organs. Instantaneous elasticity imaging techniques are non-invasive, painless, fast, convenient advantages of bedside and clinic examination, and the result is not dependent on the operator, has good repeatability, not only can be used in non traumatic liver fibrosis diagnosis, can also be used to monitor the development of liver disease, can also be used to evaluate the effect of anti fibrosis treatment.
