The global Transient Fault Recorder market size is predicted to grow from US\$ 875 million in 2025 to US\$ 1141 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

Transient Fault Recorder (TFR) is a specialized device used in electrical power systems to capture and record temporary or transient faults that may occur in the system. These faults are often short-lived and can be difficult to detect using traditional monitoring methods. The TFR is capable of capturing high-speed data, typically in the microsecond range, which allows it to accurately record the characteristics of the fault, such as its magnitude, duration, and frequency. This information is crucial for diagnosing the cause of the fault, assessing the severity of the impact on the power system, and developing strategies to prevent future occurrences. The TFR is an essential tool for maintaining the reliability and stability of electrical power systems.

United States market for Transient Fault Recorder is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
