The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Transient interferometer is a precision optical instrument based on the principle of interference measurement, used to capture and analyze changes in physical quantities in a short period of time (nanosecond to picosecond level). It can achieve high-sensitivity and high-time resolution dynamic process observation on an extremely short time scale. It uses coherent light sources such as lasers to generate interference patterns at the moment when the sample under test changes, and then analyzes the spatial and temporal evolution characteristics of transient phenomena such as stress wave propagation, shock wave evolution, material phase change, plasma behavior, etc. Transient interferometers are widely used in cutting-edge scientific research and engineering testing fields such as high-energy physics, laser plasma diagnosis, material dynamic mechanics, explosion and impact experiments, etc.

United States market for Transient Interferometer is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Transient Interferometer is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
