A transistor aging test system is a test equipment used to evaluate the stability and reliability of a transistor (usually a type of semiconductor device) over long periods of use or under specific environmental conditions. Such systems usually include test equipment, controllers, sensors and data acquisition devices, and can simulate various stress sources that transistors may encounter in practical applications, such as temperature, voltage, current, etc. By subjecting transistors to continuous or accelerated aging testing, the longevity and stability of the transistor can be assessed by detecting factors that may lead to performance degradation, malfunction, or failure. Transistor aging test systems are of great significance in electronic equipment manufacturing, power systems, communication equipment and other fields, helping to improve product quality and reliability.

The global Transistor Aging Test System market size is projected to grow from US\$ 59.5 million in 2024 to US\$ 80.6 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
