The global Transition Metals market size is predicted to grow from US\$ 1054330 million in 2025 to US\$ 1412290 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

The term 'transition metals' refers to any element that belongs to the d-block of the periodic table, which includes groups 3 through 12. A transition metal is an element having a partially filled d-subshell and can produce cations with an incomplete d-sub shell on its atom. Iron, titanium, copper, nickel, manganese, cobalt, silver, mercury, and gold are some of the transitional metals having wide applications in various end-use industries such as automotive, electronic, building & construction, and paints and coatings, and others.

Iron is the most abundant metal found in Earth's solid crust, ranking fourth among all elements and second among metals in crystal abundance (after aluminum). Transition metals are generally harder, less reactive, and denser as compared to alkali metals. For the metal industry, the US government has recommended some regulations for the welfare of human health and to control air quality, including CAA (Clean Air Act), National Environmental Policy Act (NEPA), The National Ambient Air Quality Standard (NAAQS), State Implementation Plans (SIP), New Source Performance Standards (NSPS), and National Emissions Standard for Hazardous Air Pollutants (NESHAPs).
