Translucent Wood is a type of construction material that is produced by treating and compressing wood strips. Optical transparent wood is a type of wood veneer, wherein the lignin, a component of cell walls, is removed chemically. It is an environment-friendly material compared to its alternatives such as plastic and glass. Translucent wood is a preferred construction material by builders or architects owing to its excellent set of properties such as high optical transmittance, low thermal conductivity, outstanding toughness, and lower density compared to glass.
