Abstracts

The global Transmission Diffraction Grating Beamsplitters market size is predicted to grow from US$ 42.9 million in 2025 to US$ 79.37 million in 2032; it is expected to grow at a CAGR of 9.4% from 2026 to 2032.

Transmission Diffraction Grating Beamsplitters are optical components based on the principle of multi-slit diffraction. By precisely engraving a large number of equally spaced and equally wide parallel slits on a transparent glass substrate, the composite light is dispersed during transmission, thereby achieving spectroscopic performance. This device features simple optical path design, high tolerance for alignment errors, and polarization insensitivity, making it particularly suitable for compact spectrometer systems with fixed grating configurations. Its dispersion characteristics allow for effective spectral separation on small detector arrays, but are limited by the balance between the substrate material's refractive index and the groove density. Typically, it operates at a medium groove density to balance diffraction efficiency and long-wave transmission performance, ultimately achieving efficient and stable spectroscopic operation within a specific wavelength band. Global shipments of Transmission Diffraction Grating Beamsplitters reached approximately 117k units in 2024, with a unit price of approximately US$350.

United States market for Transmission Diffraction Grating Beamsplitters is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
