The global Transmissometer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Transmissometer is an instrument for measuring the extinction coefficient of the atmosphere and sea water and determining the visual range. It works by sending a narrow collimated beam of energy (usually a laser) through a propagating medium. A narrow field of view receiver at a specified measurement distance determines how much energy reaches the detector and determines the path transmission and/or extinction coefficient. In a transmissometer, the extinction coefficient is determined by measuring the direct light transmission, which is then used to calculate the visibility range.

United States market for Transmissometer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
