## Abstracts

The global Transparent OLED Smart Window Display market size is predicted to grow from US\$ 41.09 million in 2025 to US\$ 121 million in 2032; it is expected to grow at a CAGR of 15.6% from 2026 to 2032.

A transparent OLED smart window is an intelligent display terminal that integrates transparent OLED display technology with glass windows, transportation windows, building curtain walls, showcase glass, switchable smart glass, touch interaction, information publishing, and connected control systems. Its core feature is the ability to overlay route information, advertisements, weather, news, navigation, entertainment, product information, or interactive content onto the glass surface while maintaining a certain level of light transmission and see-through visibility. This upgrades a traditional window from a simple lighting and partition component into a visual information interface.

According to LG Display's official materials, its transparent OLED offers approximately 45% transparency. LG's commercial display materials also show that Transparent OLED Signage can be installed as a single screen or tiled into larger displays, while Transparent OLED Touch can be used for interactive scenarios.

From a supply-side perspective, the transparent OLED smart window market is a narrower and more engineering-oriented segment than transparent OLED commercial displays. Its core supply chain consists of three layers. The first layer is transparent OLED panel manufacturers, with large-size supply currently highly concentrated around LG Display. The second layer includes commercial display device and system brands, such as LG Electronics, Panasonic, and Planar. The third layer consists of smart glass, touch integration, structural components, and engineering integration providers. Among

them, Gauzy has built a strong ecosystem position in transportation smart windows and high-contrast transparent displays through its collaboration with LG transparent OLED technology and SPD smart glass. In 2022, LG Display showcased a 55-inch transparent OLED window and a 30-inch transparent OLED door display at InnoTrans, with application content including driving information, transfer information, weather, and news. From a demand-structure perspective, the main market for transparent OLED smart windows is not mass consumer electronics, but rail transit, luxury retail, museum exhibitions, high-end commercial spaces, and selected premium residential applications. Rail transit is the most demonstrative application scenario because train windows naturally have high visibility and frequent exposure. Transparent OLED can overlay station arrival information, route maps, transfer guidance, advertisements, weather, news, and entertainment content without fully blocking the outside view. LG Display has disclosed that, after collecting passenger feedback on the GTX-A line, it plans to install transparent OLED panels on all trains on that line. This indicates that transportation smart windows are still in the early stage of moving from demonstration projects toward route-level deployment. From a technology-route perspective, transparent OLED smart windows face three major substitutes: transparent MicroLED, transparent LCD, and holographic or projection-based smart glass. Transparent MicroLED has strong potential in brightness and large-area display applications, but its cost and mass-production difficulty remain high. Transparent LCD is lower in cost, but its backlight and structural limitations restrict window-level integration. Holographic windshields are more suitable for front-windshield information displays in automobiles, but they are not self-emissive OLED windows. The advantages of transparent OLED lie in its self-emissive nature, high contrast, thin and lightweight structure, strong close-range display performance, and ability to form an "information layer" directly on glass surfaces. Its weaknesses include visibility under bright ambient light, burn-in risk, cost, size availability, and engineering certification requirements. Future competition will evolve around four main directions. First, transportation windows will move from demonstration routes toward batch deployment across train fleets. Second, transparent OLED will be combined with switchable glass technologies such as SPD and PDLC to improve display readability under bright ambient light. Third, touch interaction, AI recognition, advertising content management, and IoT-based operation and maintenance systems will become incremental value drivers for smart windows. Fourth, system solution providers in China, Europe, and North America will carry out secondary development based on LG panels and local engineering capabilities. Overall, transparent OLED smart windows will remain a high-end niche market in the short term, but their business model is clearer than that of transparent OLED TVs, because transportation, retail, and exhibition projects can generate clearer returns through advertising, upgraded user experience, and spatial digitalization.
