The global Transparent Sheet Production Line market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The transparent sheet production line is mainly used to produce various transparent sheets, such as PC, PMMA, GPPS, PET, MS and other materials. The production line usually consists of multiple parts, including raw material processing, extrusion molding, cooling and shaping, cutting and trimming, inspection and packaging, etc. It has a high degree of automation, high production efficiency, and stable product quality. It is widely used in construction, advertising, transportation, medicine, industry, lighting and other fields.

Among them, the raw material processing system: responsible for drying, mixing and other pre-treatment of raw materials (such as resin particles) to ensure the purity and uniformity of raw materials. Extrusion molding system: the processed raw materials are heated and melted by the extruder and then extruded to form continuous sheet blanks. The extruder is the core equipment of the production line, and its performance directly affects the quality and output of the sheet. Cooling and shaping system: the extruded sheet blank is quickly cooled through the cooling device to shape it and maintain a certain dimensional accuracy and surface quality. Cutting and trimming system: Cut and trim the cooled and shaped sheets to meet different size and shape requirements. Inspection and packaging system: Perform quality inspection on the finished sheets, including appearance, size, performance and other aspects, and package and store them after passing the inspection.
