The global Transpiration Inhibitor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Transpiration inhibitors are a class of chemicals used to reduce plant transpiration, thereby helping plants to better maintain water balance under stressful environments such as drought and high temperature. Transpiration is the process by which plants lose water from the surface of their leaves, which in dry conditions can lead to insufficient water, affecting plant growth and survival. Transpiration inhibitors reduce water loss by forming a thin film or barrier that slows the rate of water evaporation. Future transpiration inhibitors may be developed in a more environmentally friendly, non-toxic, and harmless direction to ensure that their impact on the environment and ecosystem is minimized.
