Trauma internal fixation screws are specialized screws used in orthopedic surgery to stabilize and fix bone fractures or breaks within the body. These screws work as part of an internal fixation system, which provides internal support to broken bones, allowing for proper alignment and stabilization during the healing process. Internal fixation screws are often made from materials like titanium or stainless steel, which are biocompatible and strong enough to hold bone fragments together. This approach reduces the risk of malunion or deformity, promoting faster recovery and restoring functionality in the injured bone.
