The global Travel Simulation Test Development Service market size is predicted to grow from US\$ 1329 million in 2025 to US\$ 3225 million in 2032; it is expected to grow at a CAGR of 13.6% from 2026 to 2032.

Travel simulation test development services refer to a category of technical services tailored to scenarios involving general transportation, intelligent connected vehicles, autonomous driving, urban traffic management, shared mobility, and vehicle-to-road collaboration. Leveraging technologies such as simulation modeling, traffic flow modeling, road environment modeling, vehicle dynamics modeling, sensor modeling, algorithm validation, and test platform development, these services enable clients to construct virtual mobility environments and conduct comprehensive testing and validation. Typically, these services encompass the modeling of various simulation elements?including urban roads, intersections, highways, parking lots, public transit routes, pedestrian and vehicle behaviors, weather and lighting conditions, traffic signals, and accident scenarios?to verify the safety, efficiency, and reliability of autonomous driving algorithms, traffic dispatch strategies, mobility service platforms, vehicle-to-road collaboration systems, and smart transportation solutions. These services are widely applied across fields such as autonomous driving R&D, intelligent transportation planning, logistics and delivery, public transit dispatch, road safety assessment, and urban traffic digital twins.

The upstream segment of the travel simulation test development service value chain primarily comprises foundational resources such as high-definition maps, road traffic data, vehicle dynamics models, sensor models, traffic flow models, simulation engines, cloud computing/GPU processing power, test scenario libraries, autonomous driving algorithms, vehicle-to-road collaboration equipment, and data acquisition devices. The

midstream segment consists of simulation test platform developers and technical service providers, offering services that include road and traffic scenario modeling, virtual test environment development, autonomous driving/ADAS simulation testing, mobility platform stress testing, traffic dispatch strategy validation, HIL/SIL/MIL testing, digital twin traffic simulation, and the delivery of test reports. The downstream segment primarily targets automakers, autonomous driving companies, Robotaxi operators, smart transportation enterprises, mapping service providers, public transit/logistics platforms, urban traffic management departments, highway operators, and scientific research and testing institutions; these services serve to reduce the costs associated with real-vehicle testing, enhance algorithm safety, validate traffic organization schemes, and support the development of smart mobility systems. The gross margin for travel simulation test development services stands at approximately 68%.

From the perspective of R&D in autonomous driving and intelligent mobility, the core value of travel simulation test development services lies in reducing the costs and safety risks associated with real-world road testing. Autonomous driving systems, ADAS, Robotaxis, unmanned delivery vehicles, and vehicle-road coordination systems require validation across a vast array of complex scenarios before deployment. Relying solely on physical vehicle testing is not only expensive and time-consuming but also makes it difficult?and often unsafe?to reliably reproduce hazardous scenarios such as extreme weather conditions, sudden pedestrian crossings, aggressive lane merging, and accident avoidance maneuvers. By utilizing virtual road networks, traffic participant models, sensor models, and vehicle control models, mobility simulation services construct repeatable and scalable testing environments, thereby enabling enterprises to more efficiently identify algorithmic flaws and determine system boundaries.

From the perspective of urban traffic governance, travel simulation test development services provide a data-driven basis for decision-making regarding traffic organization, signal optimization, and mobility dispatching. Urban transportation systems involve a complex interplay of factors?including vehicles, pedestrians, public transit, logistics, road infrastructure, traffic signals, parking facilities, and unforeseen incidents. Relying solely on empirical adjustments for system management can easily lead to localized optimization at the expense of overall system efficiency?resulting in widespread congestion or the wasteful allocation of resources. Through traffic flow simulation, road network modeling, travel demand forecasting, and dispatch strategy testing, administrative agencies and operational platforms can rigorously evaluate the efficacy of proposed solutions?such as signal timing adjustments, public transit route optimization, road construction detours, emergency evacuation plans, and shared

mobility vehicle dispatching prior to their actual implementation.

Looking toward future trends, travel simulation test development services are poised to evolve in the direction of high-fidelity realism, large-scale cloud-based simulation, and digital twin transportation platforms. Future competitive advantage will hinge not merely on the ability to construct simple simulation scenarios, but rather on the capacity to integrate real-world road data, high-definition maps, traffic flow data, vehicle operational data, and urban sensing data to create a continuously updating and dynamic simulation environment. As the commercialization of autonomous driving accelerates alongside the development of intelligent transportation systems and the advancement of urban digital twins, mobility simulation services will gradually transition from serving as tools for one-off project testing to functioning as long-term, continuously operational platforms for intelligent transportation validation, supporting ongoing algorithm iteration, traffic governance, risk analysis, and operational optimization.
