A vaccine is a biological preparation that improves immunity to a particular disease. A vaccine typically contains an agent that resembles a disease-causing microorganism, and is often made from weakened or killed forms of the microbe, its toxins or one of its surface proteins. The agent stimulates the body's immune system to recognize the agent as foreign, destroy it, and 'remember' it, so that the immune system can more easily recognize and destroy any of these microorganisms that it later encounters.

Travelers are at increased risk for several infections, including familiar infections such as measles that are widely distributed but more common in developing countries.

Travelers Vaccines can markedly decrease the risk for many of these infections and are an important part of pretravel preparation.

In this report, the travelers vaccines mainly covers vaccine for hepatitis A, hepatitis B, rabies, typhoid fever, yellow fever, Japanese encephalitis, meningococcal meningitis, cholera, etc.
