A travelling bridge clarifier is a type of rectangular sedimentation system commonly used in municipal and industrial water and wastewater treatment plants to remove suspended solids from liquid streams. Unlike circular clarifiers, it features a moving bridge structure that spans the width of the tank and travels longitudinally along the basin. Mounted on this bridge are essential components such as sludge scraper blades, surface scum skimmers, and sometimes feedwell baffles. As the bridge moves slowly from one end of the tank to the other—typically powered by a motorized trolley system—it collects settled sludge from the bottom and directs it toward a sludge hopper, while simultaneously removing floating debris from the surface. This design enables continuous or intermittent clarification in long rectangular basins, offering high reliability, mechanical simplicity, and cost-effectiveness for large treatment volumes. Travelling bridge clarifiers are particularly suited for retrofits and multi-unit installations, and they are valued for their ease of maintenance and adaptability to variable flow conditions.
