A Trawl Monitoring System (TMS) is a technology used in the fishing industry to monitor the operation of trawl fishing vessels. Trawl fishing involves dragging a net (trawl) through the water to catch fish or other marine organisms. The TMS typically consists of various sensors, cameras, and other monitoring equipment installed on the fishing vessel to record data such as the location of the vessel, the amount and type of catch, and the performance of the trawl gear.

The global Trawl Monitoring System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
