Abstracts

The global Trichlorofluoromethane market size is predicted to grow from US$ 51.85 million in 2025 to US$ 60.12 million in 2032; it is expected to grow at a CAGR of 2.2% from 2026 to 2032.

In 2024, global Trichlorofluoromethane production reached approximately 2,600 tons, with an average global market price of around US$ 20,000 per ton. Trichlorofluoromethane is a chlorofluorocarbon (CFC) compound with the chemical formula CCl?F, consisting of one fluorine atom and three chlorine atoms bound to a single carbon atom. It is a colorless, volatile liquid or gas with a faint sweet odor, historically used as a refrigerant (designated CFC-11 or R-11), a propellant in aerosol sprays, and a foam-blowing agent. Due to its high ozone-depleting potential and long atmospheric lifetime, its production and use have been largely phased out under the Montreal Protocol, although it can still be found in older equipment and as a trace environmental pollutant.

The key market drivers for Trichlorofluoromethane (CFC-11) are mainly linked to its legacy use and environmental regulations: residual demand arises from maintaining and servicing older refrigeration and air-conditioning systems that still operate with CFC-11, while the demolition of old buildings and appliances drives recovery and destruction activities for foam insulation containing the compound. Additionally, regulatory agencies require small quantities for calibration and atmospheric monitoring to ensure compliance with the Montreal Protocol, and occasional illegal production or trade creates enforcement-driven market dynamics. The broader transition to eco-friendly refrigerants further sustains demand for reclamation, safe disposal, and retrofitting services related to existing CFC-11 stocks.
