Trinocular inverted metallographic microscope is a kind of microscope used for observation and analysis of metallographic structure. It adopts an inverted optical path design, the light source and objective lens are installed upside down on the lower part of the microscope, and the sample is placed on the upper part of the microscope. Trinocular inverted metallographic microscopes are usually equipped with three eyepieces, which can observe three different fields of view at the same time, which is convenient for users to compare and analyze samples. In the observation of metallographic structure, the trinocular inverted metallographic microscope is usually

used together with the metallographic sample preparation equipment. By cutting, grinding and corroding the sample, the surface of the sample reveals the organizational structure, and then uses the microscope to observe and Analyze samples for characteristics such as microstructure, grain size, and distribution. Trinocular inverted metallographic microscope is widely used in materials science, metallurgy, mechanical engineering and other fields, and is an important tool for studying the microstructure and properties of materials.
