Triple Antibiotic Ointment is a topical medication that combines three different antibiotics to provide broad-spectrum protection against bacterial infections. The three primary antibiotic ingredients typically found in this ointment are bacitracin, neomycin, and polymyxin B. Each component targets different types of bacteria, collectively enhancing the overall antibacterial effectiveness of the ointment. Bacitracin inhibits bacterial cell wall synthesis, neomycin disrupts bacterial protein synthesis, and polymyxin B damages bacterial cell membranes. Triple Antibiotic Ointment is commonly used for the prevention and treatment of minor skin injuries, such as cuts, burns, and abrasions, to minimize the risk of infection and promote healing. This over-the-counter medication is available in various formulations, including creams and ointments, and is typically applied as a thin layer to clean and dry skin. While generally safe for external use, individuals with known allergies to any of the antibiotic components should exercise caution or consult with healthcare professionals before using Triple Antibiotic Ointment.

The global Triple Antibiotic Ointment market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
