The global Tritium Noble Gas Monitor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The tritium monitor consists of a tritium measurement ionization chamber and a radon compensation ionization chamber. The tritium measurement ionization chamber is composed of three parallel frames drawn with metal wires in a box with a gas inlet and outlet. The two sides are covered with aluminum polyester film. The window and the collecting plate constitute the radon compensation ionization chamber. Since the tritium ? cannot penetrate the aluminum polyester film window, the response signals output by the tritium and the radon can be separated. The monitor has a simple structure and is easy to use, and can be used for monitoring tritium in radioactive gases such as radon.
