The tritium surface contamination measuring instrument is a device used to measure the amount of surface tritium contamination. Tritium is a radioactive isotope of hydrogen that releases low energy β particles, usually used in nuclear reactors, weapons and other applications. Tritium surface contamination measurement instruments typically consist of detectors, sample holders, and data acquisition systems. The sample holder is placed on the surface to be measured, and the detector measures the tritium emission from the surface β particles. The data collection system collects and analyzes data from the detector, and calculates the amount of surface tritium contamination.
