The global True Color Night Vision Systems market size is predicted to grow from US\$ 162 million in 2025 to US\$ 487 million in 2032; it is expected to grow at a CAGR of 17.4% from 2026 to 2032.

Seeing in color is just what the human body is used to and so a typical individual can mentally process what they're seeing faster with these True Color Night Vision Systems. This more "natural" vision may help further reduce the change of a loss of situational awareness, vertigo, and other issues that traditional night vision goggles can sometimes cause, especially in airborne applications. True color night vision system still have a requirement for a certain amount of ambient light in order to function in color as infrared illuminators do not help brighten an area dramatically even at close range. So these systems can't work in total darkness without an additional source of visible light. One way to help mitigate this, at least in part, is by blending the image from a color night vision camera with the one from an infrared camera, thermal imager, or another type of optical sensor, each of which may be able to detect different details. These types of fused images have the potential to be even more detailed and high fidelity, allowing the user to determine highly specific features or even writing on objects in certain cases. Creating a self-contained multi-spectral optic with color night vision and multi-wavelength infrared capability might be another option.

Adding color night vision to the mix would allow pilots, vehicle drivers, mariners, and individual troops to get color night vision imagery projected straight onto helmet-mounted or wide area displays. Commercial entities and private citizens might use equipment to aid in flying or driving at night, as well. This would also provide major benefits in the future if paired with distributed vision systems on aircraft or ground vehicles, such as the Distributed Aperture System (DAS) on the F-35 Joint Strike

Fighter, Israeli firm Elbit's Iron Vision for tanks or Northrop Grumman's Silent Watch for ships. The U.S. Army is already working on a way to blend together imagery from thermal weapon sights with the picture an individual soldier sees through their night vision goggles.
