The global TT&C Baseband Modem market size is predicted to grow from US\$ 558 million in 2025 to US\$ 774 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

In 2025, global TT&C Baseband Modem production reached approximately 3888 units with an average global market price of around k US\$146.8 per unit. The TT&C baseband modem is a key terminal equipment used in satellite measurement and control communication systems. It integrates multiple functions such as distance measurement, speed measurement, remote control, telemetry, and data transmission. It is an important component for completing satellite tracking, telemetry, and remote control tasks. The equipment can handle measurement and control systems of different platforms, tasks, systems, and parameters, including satellite USB system and spread spectrum system measurement and control, baseband processing of digital transmission signals, as well as remote control command sending, telemetry data reception, channel simulation and other functions. Since the equipment has complex functions and contains sensitive information, it is inconvenient to operate and there is a risk of leakage during maintenance. Therefore, the localization of the equipment is of great significance to reducing costs, improving confidentiality and ease of operation.

From the perspective of corporate revenue and profit, the future industry trend for TT&C baseband modems will shift from being driven by 'standalone hardware sales' to being co-driven by 'mission-level communication capabilities, ground station network access, software-defined upgrades, and operation & maintenance services.' The underlying logic is the continuous expansion of satellite constellations, commercial space missions, deep-space exploration, low-orbit IoT, emergency communications, and defense security needs. As a result, TT&C links are no longer just supporting equipment for

launch and on-orbit control, but have become a key infrastructure for satellite operators, ground station service providers, and space equipment manufacturers to secure long-term recurring revenue. NASA has explicitly stated that it will use the Near Space Network to support Earth observation, solar research, lunar and farther missions, while providing communication and navigation services to commercial and international missions, indicating that the service-based procurement of TT&C systems will expand. China National Space Administration's 'Action Plan for High-Quality and Safe Development of Commercial Space' has incorporated commercial space into the national space master plan, emphasizing the improvement of the industrial ecosystem and resource allocation efficiency. This implies that capabilities such as TT&C baseband, ground station scheduling, frequency coordination, and security supervision will become thresholds for companies entering the commercial space supply chain. The Ministry of Industry and Information Technology (MIIT) is promoting access for satellite communication services and commercial trials of satellite IoT, which will also drive demand for low-power, wide-coverage, and remote-control TT&C capabilities. At the enterprise level, validation cases already exist: Safran's annual report disclosed that it has been selected by Airbus as the supplier for the new Syrlinks TT&C system, reflecting ongoing procurement of high-reliability TT&C equipment by satellite manufacturers. Kratos disclosed growth in its space, training, and network business segments, indicating that ground systems and defense space operations remain profit sources. KSAT and SSC continue to emphasize global ground stations, near-real-time services, cloud delivery, and optical ground stations, showing that the competitive focus in the industry is shifting from equipment delivery toward networked, automated, low-latency, and high-security services. Overall, the major trends are as follows: the scaling of commercial constellations will drive demand for standardized baseband modems; deep-space and lunar missions will boost demand for high-reliability, high-sensitivity products; defense security will promote localization and anti-jamming capabilities; cloud-based ground stations will reduce manual operation and maintenance costs. Enterprise profits will increasingly come from software licensing, long-term service agreements, network access, and mission assurance, rather than from one-time hardware sales.
