The tubular urological stapler is a medical device used for anastomosis in urological surgery. Urinary system surgery includes urethral reconstruction surgery, bladder reconstruction surgery, etc., and is commonly used in the treatment of diseases such as urethral stricture and cystectomy. The tubular urological stapler is similar to the tubular anorectal stapler and is also composed of two tubular metal rings, each with a circular cutout. During the operation, the doctor places one ring of the stapler into the urethra or bladder and the other ring into the urethra or bladder stump, and then rotates the stapler to align and close the incisions of the two rings. This creates a tube-like passage that connects the urethra or bladder stump. By using a tubular urological stapler, precise positioning and rapid closure of urethral or bladder anastomoses can be achieved, reducing surgical time and trauma, and improving surgical results and patients' quality of life. Tubular urinary staplers are widely used in urological surgery and have become one of the common surgical instruments.
