The global Tuned Liquid Damper(TLD) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A Tuned Liquid Damper (TLD) is a damping system used to reduce the vibration of structures, such as buildings or bridges, caused by external forces like wind or earthquakes. It consists of a container partially filled with liquid, typically water, mounted within the structure. The liquid's natural sloshing frequency is tuned to match the frequency of the structure's vibrations, effectively damping out the oscillations and reducing the amplitude of the vibrations. TLDs are employed in civil engineering to enhance the structural stability and safety of buildings and bridges, particularly in areas prone to high winds or seismic activity.
