The global Tuned Mass Dampers for Wind Turbines market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Tuned Mass Damper for Wind Turbine consists of an auxiliary mass which is connected to the main structure by means of springs and damper elements. The intrinsic frequency of the tuned mass damper is essentially defined by its spring constant and a damping ratio determined by the damper. The tuning parameters of the tuned mass damper enable the auxiliary mass to oscillate with a phase shift relative to the motion of the structure. In a typical configuration, the auxiliary mass is suspended below the nacelle of the wind turbine, supported by a damper or friction plate.
