The global Tungsten Carbide Drills with Internal Coolant market size is predicted to grow from US\$ 1057 million in 2025 to US\$ 1409 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Tungsten Carbide Drills with Internal Coolant is a high-performance metalworking tool designed for hole machining. Its body is fabricated from high-hardness, highly wear-resistant tungsten carbide (cemented carbide) and features internal cooling channels (internal coolant holes) engineered to extend directly to the cutting edges. During machining operations, coolant flows internally straight to the cutting edge, thereby significantly enhancing chip evacuation efficiency and heat dissipation capabilities.

The upstream supply chain primarily comprises tungsten carbide powder, cobalt powder, grain growth inhibitors, internally cooled cemented carbide rods, coating materials, and coolant-compatible materials. Among these, the cemented carbide rod with internal cooling channels serves as the most critical raw material, as it directly determines the geometry of the drill's cooling channels, as well as its rigidity, toughness, and machining stability.

In 2025, global sales volume is projected to reach approximately 29 million units, with an average global market price of approximately \$37 per unit; leading manufacturers in the industry are expected to maintain gross margins ranging from 35% to 50%.
