Tungsten filament electron gun is a key component in scanning electron microscope (SEM), which is used to generate, accelerate and converge high energy density electron beam. When the tungsten filament is powered on and heated, a large number of hot electrons are generated on the surface. Under the action of the high voltage electric field between the anode and the cathode, the hot electrons are accelerated to move at high speed toward the anode and obtain high kinetic energy. Through the action of the focusing coil, the electron beam can be focused to form a small and concentrated electron beam. Tungsten filament electron guns have been widely used in scientific research, material analysis, biomedicine and other fields. With the continuous advancement of technology, the performance of tungsten filament electron guns is also gradually improving, such as by optimizing the filament material and structure to extend the service life and improve the emission efficiency.

The global Tungsten Filament Electron Gun market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
