The global Tunnel Earthquake Wave Prediction Method market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The tunnel earthquake wave prediction method is an important technical means for tunnel advance geological prediction. The tunnel earthquake wave prediction method excites earthquake waves in an array in the tunnel (usually generated by small-charge blasting), and the earthquake wave signals propagate in the form of spherical waves along the tunnel direction. When these earthquake waves encounter different rock layers or geological interfaces, they will be reflected due to differences in medium properties (such as acoustic impedance, wave velocity, etc.). These reflected waves are then received by high-precision receivers arranged in the tunnel and input into special instruments for signal amplification, digital acquisition and processing. By analyzing the received reflected wave signals, the properties of the surrounding rock in front, the distribution of joints and fissures, weak rock layers and water content can be inferred, and then the geological conditions in front of the tunnel face and the surrounding areas can be predicted and forecasted.

The core of the tunnel earthquake wave prediction method is to use the propagation and reflection characteristics of earthquake waves in different media, artificially excite earthquake waves and receive their reflected signals to indirectly infer the geological conditions in front. This method has the advantages of long detection distance, strong anti-interference and high resolution, and has been widely used in tunnel engineering.
