The global Tunnel Hot Air Circulation Oven market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The tunnel-type hot air circulation oven is a device that uses hot air circulation technology to dry materials. It adopts a tunnel structure, and the hot air is evenly transported to the inside of the oven through the hot air circulation system to dry the materials continuously and efficiently.

The working principle of the tunnel-type hot air circulation oven is to use the convection and radiation of hot air to increase the temperature of the surface of the material and evaporate the moisture, thereby achieving the purpose of drying. Specifically, the high-temperature hot air generated by the heating system forms a hot air flow inside the oven under the action of the circulating fan. When the material enters the oven, the hot air flow will quickly evaporate the moisture on its surface and dry the product at high temperature. At the same time, because the hot air flow circulates continuously inside the oven, the material is heated more evenly, which improves the drying effect.

The tunnel-type hot air circulation oven is mainly composed of a box body, a heating system, a circulating fan, a conveying system, a control system and other parts. Among them, the box body is usually made of stainless steel, which has good corrosion resistance and high temperature resistance; the heating system is responsible for providing a constant temperature for the oven; the circulating fan is used to circulate hot air inside the oven; the conveying system is responsible for sending the materials to be dried into the oven and sending the dried materials out; the control system is responsible for monitoring and adjusting the operation of the entire oven to achieve

automatic control.
