Single-line production capacity is approximately 3 tons per year, with an average gross profit margin of approximately 40-60%. Turbidity Standard is reference substances used to measure the degree to which suspended matter in water obstructs light transmission, i.e., water turbidity. They are typically prepared using formazin as a reference substance, and their turbidity values ??are expressed in formazin turbidity units (FTU) or nephelometric turbidity units (NTU). Turbidity standard solutions are used to calibrate turbidimeters and conduct water quality comparisons to ensure the accuracy of measurement results.

The upstream supply chain for Turbidity Standard primarily includes chemical companies that provide basic raw materials (such as manufacturers of polymer microspheres or formazin), high-purity solvent suppliers, and manufacturers of packaging materials such as glass and plastic bottles. Downstream, turbidity standard solutions are directly used in laboratories or online monitoring systems at environmental monitoring stations, water companies, sewage treatment plants, and industrial enterprises such as food and pharmaceuticals to calibrate turbidity meters and ensure the accuracy and compliance of water quality monitoring data.

United States market for Turbidity Standard is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
