The global Turbo Air Classifier market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The turbo air classifier generates a strong vortex field through a high-speed rotating turbine to classify the material particles in the air flow. After the material particles enter the classification chamber through the feeding pipe, they move upward with the rising airflow and are affected by centrifugal force in the blade gap of the turbine, thereby achieving separation of coarse and fine particles. The turbo air classifier can classify various organic and inorganic materials. The product fineness can be selected from 2 to 150 microns. It is suitable for materials in various shapes such as spherical, flake and fibrous shapes.

United States market for Turbo Air Classifier is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
